Currently the Standard Catalog Framework and the Catalog REST Endpoint use the Source Poller to get source availabilities. The `pollIntervalMinutes` should not be set to value a which results in an unacceptable maximum delay.	1	true

Solr Catalog Application Reference

DDF uses Solr for data storage, by default.

- Platform
- Catalog

Spatial Application Reference

The Spatial Application provides KML transformer and a KML network link endpoint that allows a user to generate a View-based KML Query Results Network Link.

Offline Gazetteer Service

In the Spatial Application, the `offline-gazetteer` is installed by default. This feature enables you to use an offline source of GeoNames data (as an alternative to the GeoNames Web service enabled by the `webservice-gazetteer` feature) to perform searches via the gazetteer search box in the Search UI.

Installing the `offline-gazetteer-index` feature will provide a small set of GeoNames data to use with the offline gazetteer. The GeoNames data is stored as metacards in the core catalog and are tagged with `geonames` and `gazetteer`. This collection of GeoNames metacards can be expanded or updated by using the `gazetteer:update` command.

Spatial Gazetteer Console Commands

The `gazetteer` commands provide the ability to interact with the local GeoNames metacard collection in the core catalog. These GeoNames metacards are used by the `offline-gazetteer` feature, which is an optional feature available in this application and is explained above. Note that these commands are only available if the `offline-gazetteer` feature is installed.

Table 61. Gazetteer Command Descriptions

Command	Description

`gazetteer:update`	Adds new gazetteer metacards to the core catalog from a resource.
	
	The resource argument can be one of three types:
	
	• a local file path to a `.txt`, `.zip`, or `.geo.json` GeoNames data file. If a path to a file ends in .geo.json, it will processed as a geoJSON feature collection and imported as supplementary shape data for GeoNames entries.
	• a URL to a `.txt` or `.zip` GeoNames data file. GeoJSON URLs are not supported.
	• a keyword to automatically process a GeoNames file from from http://download.geonames.org/export/dump. Valid keywords include
	
	  ◦ a country code, which will add the country as GeoNames metacards in the core catalog. The full list of country codes available can be found in http://download.geonames.org/export/dump/countryInfo.txt.
	  ◦ `cities1000`, `cities5000`, and `cities15000`, which will add cities to the index that have at least 1000, 5000, or 15000 people, respectively.
	  ◦ `all`, which will download all of the current country codes. This process may take some time.
	
	The `-c` or `--create` flag can be used to clear out the existing gazetteer metacards before adding new entries.

`build-suggester-index`	Builds the Solr suggester index used for placename autocompletion in Intrigue when using the offline gazetteer. This index is built automatically whenever gazetteer metacards are created, updated, or deleted, but if those builds fail then this command can be used to attempt to build the index again.

Application Whitelists

Within each DDF application, certain packages are exported for use by third parties.

Packages Removed From Whitelist

In the transition of the whitelist from the ambiguous package listing to the new class listing several errors were found. The packages originally listed that were removed either did not exist, contained experimental interfaces, or contained only internal implementations and should have never been included in the whitelist. The following is a list of packages that were listed in error and have been removed from the whitelist.

NOTE	None of the packages in this list have been removed from the distribution. They may however be changed or removed in the future.
